

Nielsen Norman Group **Heuristic Evaluation Workbook**

Use this workbook to conduct your own heuristic evaluation.

For each of Jakob's 10 Usability Heuristics, look for specific places where the interface fails to adhere to the guideline. Write your recommendations for how to fix those usability issues.

Heuristic Evaluation Workbook

EVALUATOR:

DATE:

PRODUCT:

TASK:

1

Visibility of System Status

The design should always keep users informed about what is going on, through appropriate feedback within a reasonable amount of time.

- Does the design clearly communicate its state?
- Is feedback presented quickly after user actions?

Issues

While the progress bar in the registration sequence/setup screens is effective, there is a lack of confirmation right before moving to the main interface. The system lacks a clear step indicating that the account and business configuration are fully ready.

Recommendations

Add a final status confirmation screen/message after Step 4 (before transitioning to the Dashboard) to explicitly inform users that their account setup is complete.

2

Match Between System and the Real World

The design should speak the users' language. Use words, phrases, and concepts familiar to the user, rather than internal jargon. Follow real-world conventions, making information appear in a natural and logical order.

- Will user be familiar with the terminology used in the design?
- Do the design's controls follow real-world conventions?

Issues

Recommendations

Heuristic Evaluation Workbook

3

User Control and Freedom

Users often perform actions by mistake. They need a clearly marked "emergency exit" to leave the unwanted action without having to go through an extended process.

- Does the design allow users to go back a step in the process?
- Are exit links easily discoverable?
- Can users easily cancel an action?
- Is *Undo* and *Redo* supported?

Issues

Lack of navigation consistency across the transaction history, category assignment, and filtering interfaces. Users don't have a standardized way to safely exit or retreat from a transaction action.

Recommendations

Standardize and implement consistent "Back" and "Cancel" buttons across all transaction-related screens to give users better control over their navigation path.

4

Consistency and Standards

Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform and industry conventions.

- Does the design follow industry conventions?
- Are visual treatments used consistently throughout the design?

Issues

Recommendations

Heuristic Evaluation Workbook

5

Error Prevention

Good error messages are important, but the best designs carefully prevent problems from occurring in the first place. Either eliminate error-prone conditions, or check for them and present users with a confirmation option before they commit to the action.

- Does the design prevent slips by using helpful constraints?
- Does the design warn users before they perform risky actions?

Issues

Recommendations

6

Recognition Rather Than Recall

Minimize the user's memory load by making elements, actions, and options visible. The user should not have to remember information from one part of the interface to another. Information required to use the design (e.g. field labels or menu items) should be visible or easily retrievable when needed.

- Does the design keep important information visible, so that users do not have to memorize it?
- Does the design offer help in-context?

Issues

The existing "Active Filter" tags are successfully functioning to help users recognize current parameters without forcing them to recall what they searched for. However, the filtering system and transaction labels required a review to ensure memory load stays low across screen transitions

Recommendations

Maintain the active filter tags , but ensure that category tags and filter labels remain explicitly clear and visible so users don't have to memorize previous input states.

Heuristic Evaluation Workbook

7

Flexibility and Efficiency of Use

Shortcuts — hidden from novice users — may speed up the interaction for the expert user such that the design can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

- Does the design provide accelerators like keyboard shortcuts and touch gestures?
- Is content and functionality personalized or customized for individual users?

Issues

Recommendations

8

Aesthetic and Minimalist Design

Interfaces should not contain information that is irrelevant or rarely needed. Every extra unit of information in an interface competes with the relevant units of information and diminishes their relative visibility.

- Is the visual design and content focused on the essentials?
- Have all distracting, unnecessary elements been removed?

Issues

The data visualization charts ("Daily Summary," "Weekly Overview," and "Peak Activity") contain unnecessary dashed visual borders. This creates unnecessary visual noise and distracts from core financial metrics.

Recommendations

Remove the dashed borders from the main Dashboard graphs and refine visual boundaries/data tooltips. This will reduce visual clutter and prioritize the immediate visibility of critical data like "Net Balance" and "Recent Transactions".

Heuristic Evaluation Workbook

9

Help Users Recognize, Diagnose, and Recover from Errors

Error messages should be expressed in plain language (no error codes), precisely indicate the problem, and constructively suggest a solution.

- Does the design use traditional error message visuals, like bold, red text?
- Does the design offer a solution that solves the error immediately?

Issues

Recommendations

10

Help and Documentation

It's best if the system doesn't need any additional explanation. However, it may be necessary to provide documentation to help users understand how to complete their tasks.

- Is help documentation easy to search?
- Is help provided in context right at the moment when the user requires it?

Issues

Recommendations
